Bridges to a better life/Puentes hacia una mejor vida was a collaborative study between the Institute for Behavioral and Community Health affiliated with San Diego State University Research Foundation and Clínicas de Salud del Pueblo, Inc. (Clínicas), a federally qualified health center. This randomized controlled trial (peer support intervention versus usual care) was designed to research potentially efficacious and disseminable methods for delivering a volunteer-based peer support intervention through community health centers serving a U.S. Latino/Hispanic community on the U.S.-Mexico border in California.

**Population & Setting**
Mexican/Mexican-American adults randomly selected from the patient rosters of three of Clínicas’ largest health centers located in Brawley, El Centro, and Calexico, CA.

**Who Are the Peer Supporters?**
Peer leaders (lideres) were required to have previous diabetes education or significant experience helping someone manage their diabetes. Invitation letters were mailed to Clínicas’ patients who had completed the diabetes education program and the study coordinator followed up with a telephone call. Peer leaders were also recruited one-on-one by members of the Department of Programs at Clínicas from among their social networks and clinicians were asked to refer patients they thought would make a good leader. Eligible peer leaders were screened to ensure they, a) could read and speak Spanish, English, or both, b) were living with or had provided extensive care for someone with diabetes, c) were willing to provide support to several patients for at least 12 months, and d) planned to remain in the study area for 12 months. A total of 34 peer leaders were enrolled in the study.

**Peer Supporter Training**

Peer leaders attended 40-50 hours of training. Each clinic based their training format and structure on what worked best for the peer leaders (e.g., 3 days a week for 6 hours, 4 evenings a week for 4 hours). Training materials included manuals for both trainers and peer leaders, each consisting of 10 lessons on the following topics: building your opportunities as a volunteer, providing support for diabetes, diabetes and nutrition, diabetes and physical activity, diabetes and emotional health, diabetes and medical management, how to conduct a home visit, how to conduct a visit to the clinic, how to conduct a support group, and how to monitor your activities. Two supplementary trainings were developed on how to lead physical activity support groups and cooking support groups.

**Peer Supporter Roles & Responsibilities**

Peer leaders were assigned 5-8 patients each and they were instructed to contact them a minimum of 8 times during the first 6 months and as needed during the subsequent 6 months of the 12-month intervention. Contact was to occur in the following order: a) introductory phone call, b) introductory letter, c) home visit and delivery of a welcome packet that included a business card, a copy of the welcome letter, and a 10-page pamphlet with key pages from the peer leader training manual. Peer leaders had the option of conducting all remaining contact by way of supportive telephone calls, home visits, support groups, or clinic tours depending on the preferences of the peer leader and the patient. Contact was primarily in the form of one-on-one visits and by telephone.

**TRAINING SUMMARY**

**Duration:** 40-50 hours

**Content:**
- Building your opportunities as a volunteer
- Providing support for diabetes
- Diabetes and nutrition
- Diabetes and physical activity
- Diabetes and emotional health
- Diabetes and medical management
- How to conduct a home visit
- How to conduct a visit to the clinic
- How to conduct a support group
- How to monitor your activities

**PLUS** two supplementary trainings on how to lead physical activity support groups and cooking support groups

**Approach:** Didactic and interactive components and opportunities to share personal experiences and to practice the skills

**Evaluation:**
- Diabetes knowledge*: post-training, plus 6- and 12-mos post-baseline
- Open-ended questions*: 6- and 12-mos post-baseline
- Satisfaction with training and program support: 6- and 12-mos post-baseline

* Participants who scored <80% on the test were given additional instructions in key areas

**Languages:** English & Spanish
**Unique Features or Strengths**

The peer support interventions were tailored to address the socio-ecologic perspective. Particularly, peer supporters had the flexibility to help and support diabetes self-management behaviors in multiple contexts (home, community, and clinic).

**Major Challenges & How They Were Addressed**

- **Reach and engagement:** In the first 6 months an average of only 4 contacts was achieved despite several attempts to contact patients. Peer leaders were encouraged to tell project staff which patients they were having trouble engaging and the patient tracking form was adapted to make it easier to complete. To motivate peer leaders and keep them engaged, 6- and 12-month celebrations were held to strengthen family support for their participation and bi-weekly meetings were held with the Program Coordinator.

- **Travel expenses:** A major barrier for peer leaders in maintaining contact with their assigned patients was out-of-pocket expenses due to inadequate public transportation in this rural community. To compensate, peer leaders were provided gas cards valued at $15 per month at their 6-month anniversaries.

**Key Results & Major Accomplishments**

Volunteer peer support models compliment paying models and both are essential for community clinics to adequately reach those in rural and resource-poor communities. With intervention participants exhibiting a 0.4% reduction in HbA1c, compared to no change in HbA1c with controls, this volunteer-based intervention significantly improved HbA1c levels. Small improvements in dietary intake of fruits and vegetables and fast food were also observed in the intervention versus control group participants. In addition, participants in both conditions reported greater use of planned health care to support their diabetes, more frequent self-monitoring behaviors, and greater adherence to medication use.
